CASE DATA:

The Washington State Disease Reporting System (WDRS) is the data source for all case data. Some data have been suppressed due to inaccuracies. Not all tables and graphs will have the same denominator. All trend data are by symptom onset date or date of first positive COVID test. All data are preliminary and subject to change.

SNOHOMISH COUNTY SUMMARY:

- Snohomish County case rates continue to decline. Only cases tested by a healthcare provider or laboratory are counted in this report. The trend seen may be due to declines in availability of healthcare provider testing and increases in home-based testing with rapid antigen kits. Home-based tests are not reported to public health and are not included in these data.
- COVID-19-related hospitalizations were steady at 1.8/100,000.
- COVID-19 transmission was <50/100,000 across all zip codes in Snohomish County.
- Case rates decreased or were steady amongst most age groups. Small increases in case rates were seen amongst 15-19- and 70-79-year-old age groups. Highest case rates are amongst our 70+ population, which is due to higher rates of testing, and small population size.
- We saw decreases in cases week to week for all race/ethnicity groups.
- There were minimal cases associated with reported LTCF outbreaks in the past few weeks. There have been 2 new LTCF outbreak for the past month.
