

Weekly COVID-19 Graphs

January 1 – June 10, 2023

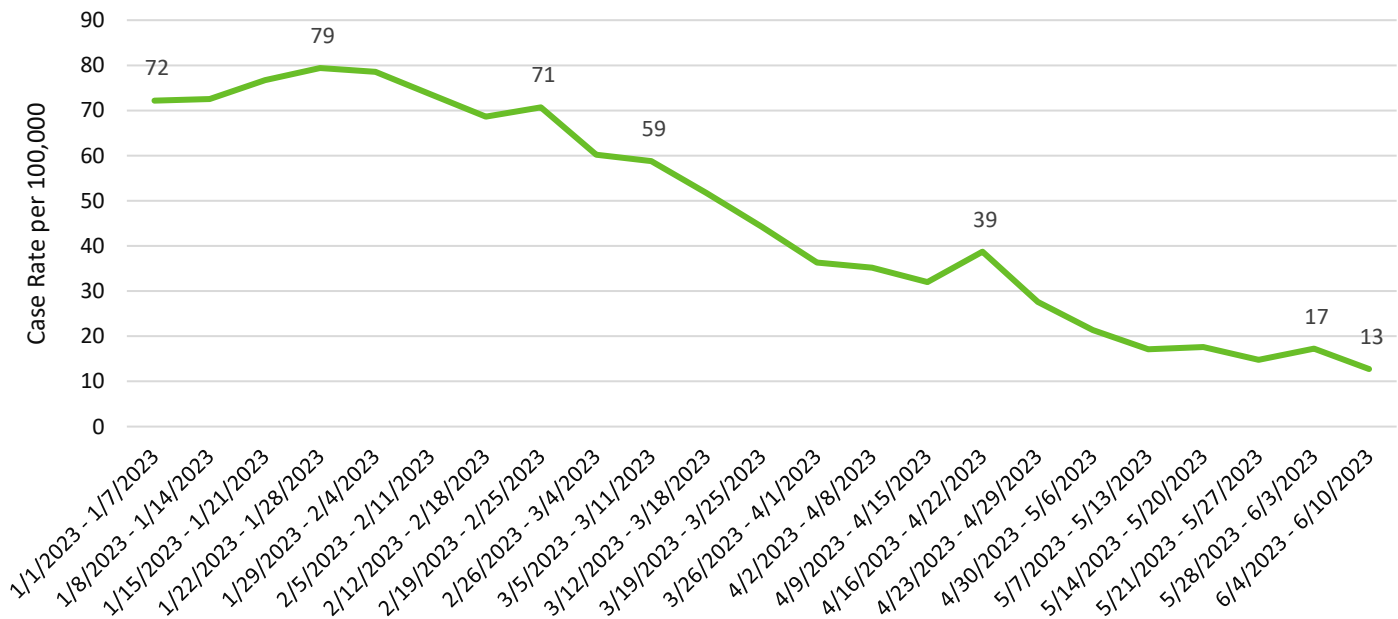

CASE DATA:

The Washington State Disease Reporting System (WDRS) is the data source for all case data. Some data have been suppressed due to inaccuracies. Not all tables and graphs will have the same denominator. All trend data are by symptom onset date or date of first positive COVID test. All data are preliminary and subject to change.

SNOHOMSH COUNTY SUMMARY:

- Snohomish County case rates continue to decline. Only cases tested by a healthcare provider or laboratory are counted in this report. The trend seen may be due to declines in availability of healthcare provider testing and increases in homebased testing with rapid antigen kits. Homebased tests are not reported to public health and are not included in these data.
- COVID-19-related hospitalizations were down from the previous week at 1.4/100,000.
- COVID-19 transmission was <50/100,000 across all zip codes in Snohomish County.
- Case rates decreased amongst most age groups. A small increase was seen in the 80+-year-old age group. Highest case-rates are amongst our 70+ population, which is due to higher rates of testing, and small population size.
- Case rates week to week were steady or decreased for most race/ethnicity groups. Small increases were seen in Asian and Black/African American groups.
- There were minimal cases associated with reported LTCF outbreaks in the past few weeks. There were 4 new LTCF outbreak for the past month.
