

Weekly COVID-19 Graphs

January 1 – July 15, 2023

CASE DATA:

The Washington State Disease Reporting System (WDRS) is the data source for all case data. Some data have been suppressed due to inaccuracies. Not all tables and graphs will have the same denominator. All trend data are by symptom onset date or date of first positive COVID test. All data are preliminary and subject to change.

SNOHOMSH COUNTY SUMMARY:

- Snohomish County case rates remain relatively steady. Only cases tested by a healthcare provider or laboratory are counted in this report. The downward trend seen in recent months may be due to declines in availability of healthcare provider testing and increases in homebased testing with rapid antigen kits. Homebased tests are not reported to public health and are not included in these data.
- COVID-19-related hospitalizations decreased from the previous weeks at 1.2/100,000.
- COVID-19 transmission was <50/100,000 across all zip codes in Snohomish County.
- Case rates decreased amongst all age groups except 80+ years of age. While the case rate doubled in the 80+ age group they are a relatively small population which creates more dramatic changes week to week. Highest case-rates are amongst our 70+ population, which is due to higher rates of testing, and small population size.
- Case rates week to week were steady or decreased for most race/ethnicity groups. Increases were seen in American Indian/Alaska Native and Black/African American groups.
- There has been a decrease in the number of cases associated with reported LTCF outbreaks in the past couple of weeks. There have been 8 new LTCF outbreak in the past month.
